

Introduction to Geospatial Analysis

Key Concepts

Spatial Data: Two main types of spatial data are **vector data** and **raster data**

Vector Data

- Are points, lines, or polygons
- Common file formats include shapefiles (.shp) and geojsons (.geojson)
- Examples:
 - **Polygons** of countries
 - **Polylines** of roads
 - **Points** of households

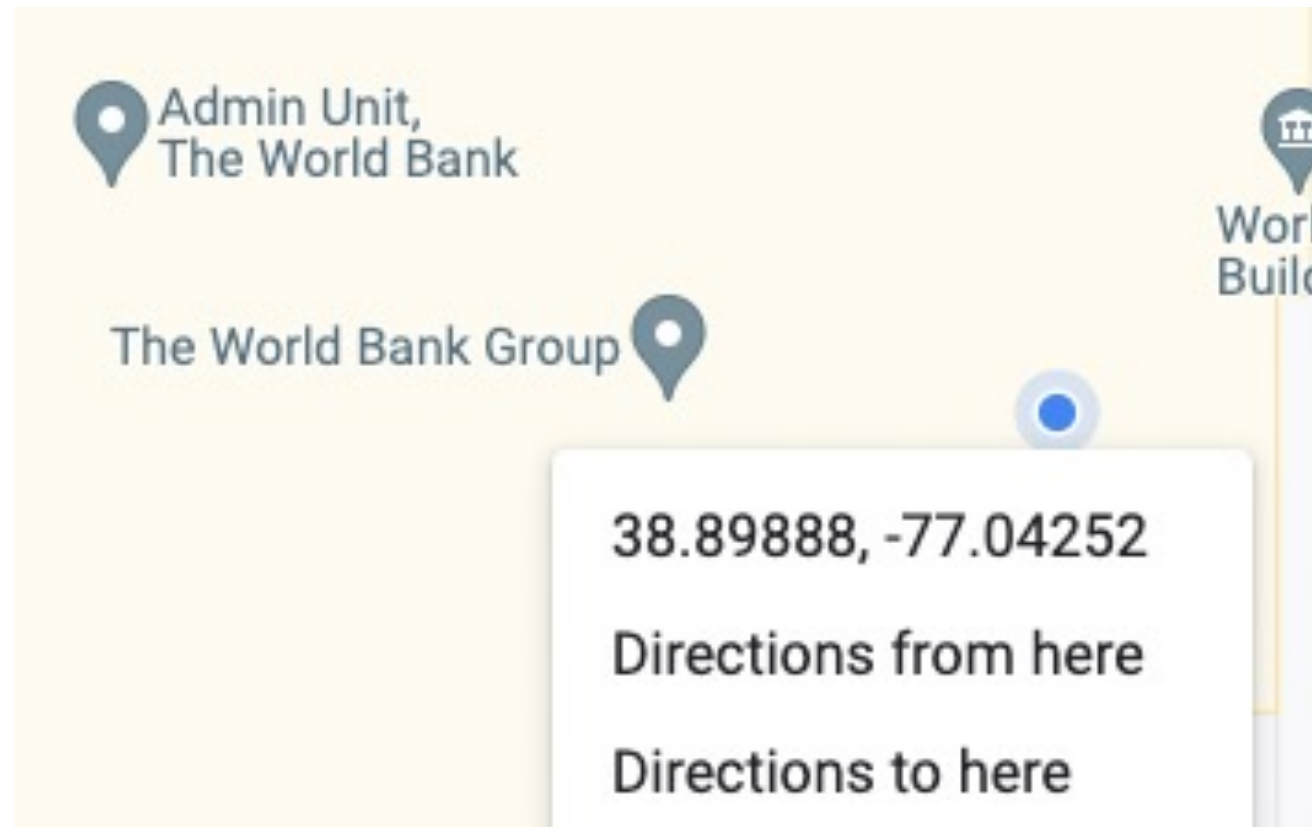

Raster Data

- Is a spatially referenced grid
- Common file format is a geotif (.tif)
- For example, satellite imagery comes in a raster format

Coordinate Reference Systems (CRS)

- Coordinate reference systems use pairs of numbers to define a location on the earth
- For example, the World Bank is at a latitude of 38.89 and a longitude of -77.04

Coordinate Reference Systems

There are many different coordinate reference systems, which can be grouped into **geographic** and **projected** coordinate reference systems. Geographic systems live on a sphere, while projected systems are “projected” onto a flat surface.

Geographic (Sphere)

Projected (Flat)

Geographic Coordinate Systems

Units: Defined by latitude and longitude, which measure angles and units are typically in decimal degrees. (Eg, angle is latitude from the equator).

Latitude & Longitude: On a grid X = longitude, Y = latitude.

- Sometimes represented as (longitude, latitude).
- Also has become convention to report them in alphabetical order: (latitude, longitude) — such as in Google Maps.
- Valid range of latitude: -90 to 90
- Valid range of longitude: -180 to 180
- {Tip} Latitude sounds (and looks!) like latter.

Microsoft Illustration

Geographic Coordinate Systems

Distance on a sphere

- At the equator (latitude = 0), a 1 decimal degree longitude distance is about 111km; towards the poles (latitude = -90 or 90), a 1 decimal degree longitude distance converges to 0 km.
- We must be careful (ie, use algorithms that account for a spherical earth) to calculate distances! The distance along a sphere is referred to as a [great circle distance](#).

Geographic Coordinate Systems

Datums

- Is the earth flat? No!
- Is the earth a sphere? No!
- Is the earth a lumpy ellipsoid? [Yes!](#)

The earth is a lumpy ellipsoid, a bit flattened at the poles.

- A [datum](#) is a model of the earth that is used in mapping. One of the most common datums is [WGS 84](#), which is used by the Global Positional System (GPS).
- A datum is a reference ellipsoid that approximates the shape of the earth.
- Other datums exist, and the latitude and longitude values for a specific location will be different depending on the datum.

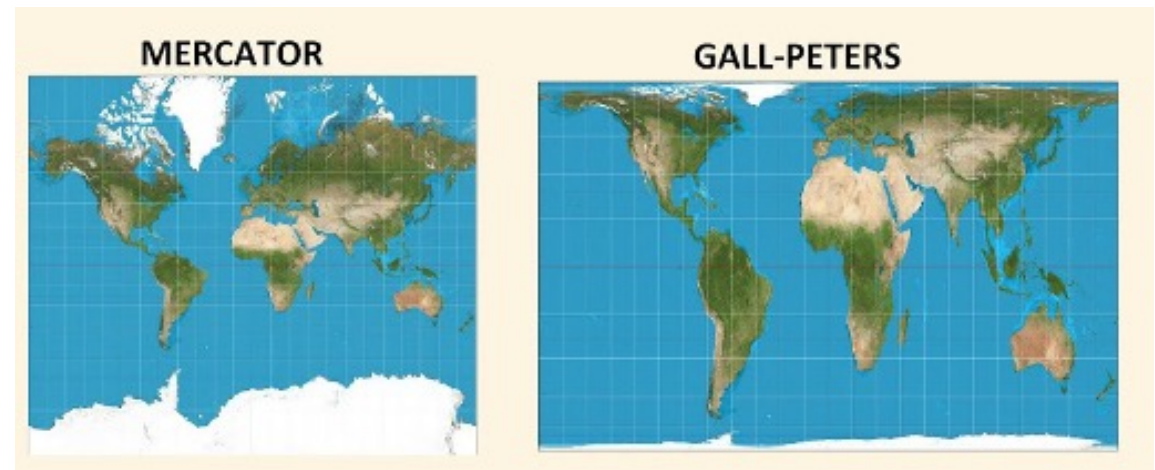

Projected Coordinate Systems

Projected coordinate systems project spatial data from a 3D to 2D surface.

Distortions: Projections will distort some combination of distance, area, shape or direction. Different projections can minimize distorting some aspect at the expense of others.

Units: When projected, points are represented as “northings” and “eastings.” Values are often represented in meters, where northings/eastings are the meter distance from some reference point. Consequently, values can be very large!

Click [here](#) to see why Toby & CJ are confused
(hint: projections!)

Projected Coordinate Systems

Coordinate Reference Systems

Whenever have spatial data, need to know which coordinate reference system (CRS) the data is in.

- You wouldn't say "I am 5 away"
- You would say "I am 5 [miles / kilometers / minutes / hours] away" (units!)
- Similarly, a "complete" way to describe location would be: I am at 6.51 latitude, 3.52 longitude using the WGS 84 CRS

Referencing Coordinate Reference Systems

Coordinate reference systems can be referenced in multiple ways.

PROJ: One standard way of referencing CRSs is defined by [PROJ](#) (a CRS library):

- **WGS 84:** `+proj=longlat +datum=WGS84 +no_defs +type=crs`
- **Mercator Projection:** `+proj=merc +lat_ts=0 +lon_0=0 +x_0=0 +y_0=0 +R=6371000 +units=m +no_defs +type=crs`

EPSG: PROJ (and other systems) can be cumbersome. The European Petroleum Survey Group (EPSG) publishes a [database](#) of CRSs that provides a numeric ID to each CRS:

- **WGS 84:** [EPSG:4326](#)
- **Mercator Projection:** [EPSG:53004](#)
